Objective:
Create a simple one page web application allowing a user to search for a TV Show. When the show is selected display the show's name/description/network, a large image and the first 3 episodes. Each episode should also have an image and description. Use the free API at thetvdb.com for the data. There should also be a link at the bottom to the show's page on imdb.com. When a show is selected the url should change with new data being displayed but the page should NOT refresh. The url should remain clean and never have a question mark (?) or hash mark (#)

Make sure to utilize the following technologies:
PHP 7, MySQL, Ajax, Javascript/jQuery, HTML 5, CSS 3, REST API, JSON

TheTVDB.com API:
https://api.thetvdb.com/swagger

API Auth:
{
  "apikey": "LENC7CQ2WUH4PB87",
  "userkey": "17MSCXAHS7FO09C5",
  "username": "jfrs506zo"
}

What are we looking for?
- if the application completes all requirements listed above without any bugs
- if the code is concise, and executes quickly
- if the code is organized and easy to follow. I don't need everything commented out but at least the major areas
- if the html is easily separated from the code for a designer to work with

When finished email back the code in a .zip file or provide a github repo
